 to know about building and flying control-line models is in:

FLYING AROUND

from Brodak Mfg. & Dist. Co., Inc.

BH-1600 - 10.99

DISK PRICE
\$19.95
 includes S&H
 U.S. postage

This disk contains two complete and complimentary parts. The first part is a copy of the two part **Control Line World** magazine published in **October 2007** and **January 2008** by John Brodak. It's largely a series of monographs organized in an autobiographical format. According to Microsoft's Wordtools/word count, this part contains 25,047 words and 61 photos. Most of the monographs in this part are technical explanations of various features of competition control line stunt ships. These features appeared about forty years ago and were mostly, my original work. The rest of this first part relates to the process of designing progressively capable and realistic semi-scale airplanes.

The second part is a comprehensive construction tutorial containing another 53,662 words and 534 photos. It is a hand holding tutorial covering the complete construction and finishing of a semi-scale "Snaggletooth" Mustang. It covers much more than just the building of a specific airplane. It also contains a wealth of construction and finishing techniques, all explained in great detail with illustrating photos. It has also been published in the control line forum Stuka Stunt in its entirety and can be downloaded there in eight parts. This disk combines the information from two magazines and the eight parts from the forum to make a single source reference to subjects of interest to builders of control line stunt ships.
